

# Interoperability

## History and Lessons for B2B Networks

**SOFTWARE PLATFORM**  
Consulting, Inc

- There is no perfect definition
- For our purposes in B2B, let's go with:
- “The ability to render useful data and other information across systems, applications, or components”
  - We can also add companies, developers and development platforms to that list

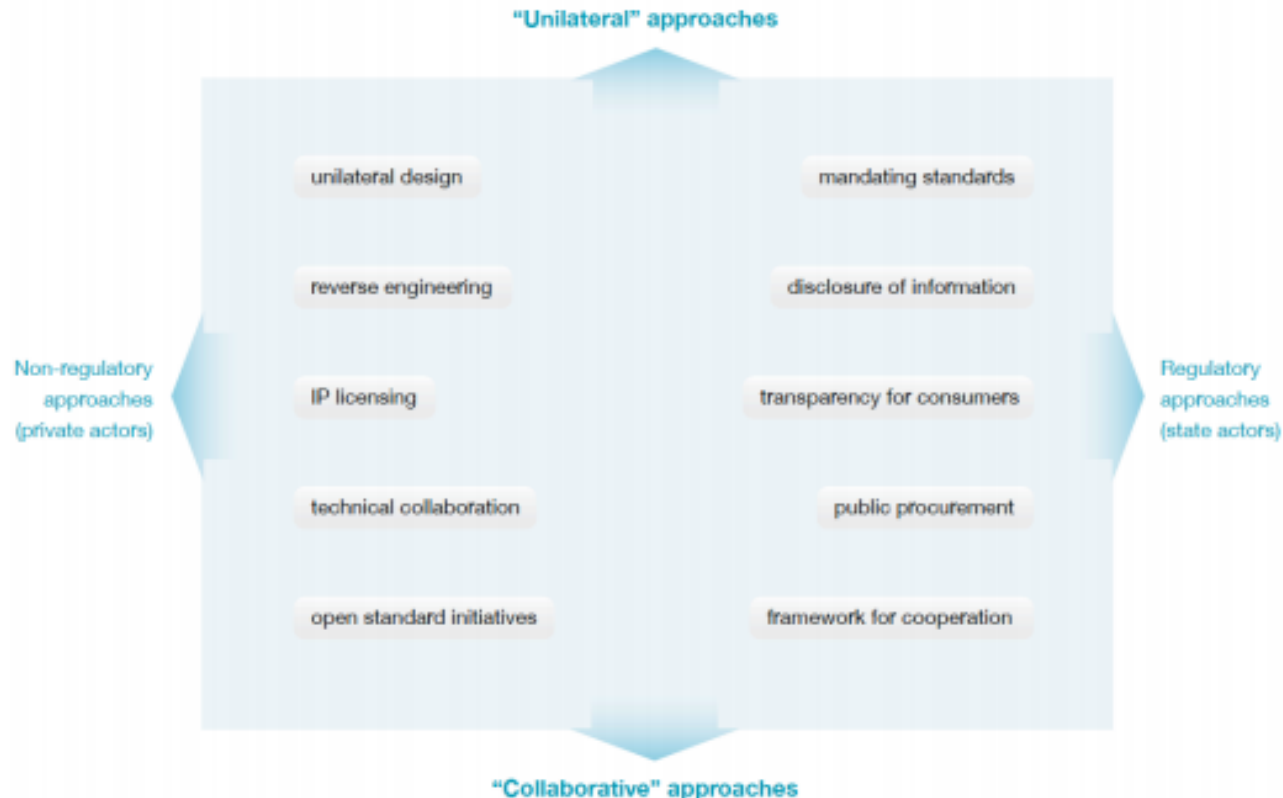

Note that none of the last three layers is binary, all are shades of grey

- To be interoperable means to be able to work together, *not to be identical*
- Consider almost all examples
  - Train systems share rail width, but not car, cargo and speed types
  - Currencies differ, but we can exchange them (with some expense!)
  - Cell phone networks can share voice, yet are not identical
  - Bank ATMs work together to allow us to get our money, but have different interfaces and capabilities
- Interoperability is not about “yes” or “no”
- It is about getting the elements that need to work together right, while letting systems continue to differentiate
  - APIs are a great example
  - They allow us to more easily share data, but innovate on top of this data

- The good news is that interoperability can:
  - Bring benefits and efficiency to end customers
  - Help them avoid lock-in and so grow markets
  - Support innovation
- The bad news is that interoperability can also:
  - Bring down whole systems (e.g., viruses, economic meltdowns)
  - Done wrong, interoperability can stifle innovation and lead to lock-in

# How does interoperability come about?

- In a variety of ways based on two dimensions
  - Unilateral
  - Collaborative
  - Regulatory and non-regulatory

by [John Palfrey](#) (Author), [Urs Gasser](#) (Author)

## Physical

- Trains
- Currency
- Diesel Gas Nozzles
- Electricity

## Logistics

- UPC/Barcode
- Pallets
- Shipping containers
- EDI

## Financial

- Credit cards
- ACH
- Bank ATMs
- EMV Chip and Pin

## Workplace PC

- Office Docs
- Mac and PC
- Email
- Calendar
- Search Engine

## Enterprise SW

- ERP
- ID Mgmt
- API
- PAAS

## Home Entertainment

- E-readers
- MP3 players
- Game consoles
- Social networks
- TV networks
- IM

## Telecom

- Land lines
- Cell Networks
- USB chargers
- Fax machines

Example	Date	Narrative	Gov't	Cost/Adapters
Trains	1800s	<ul style="list-style-type: none"> <li>Began in UK, Royal Commission chose gauge of largest railway; made its way around world since most eqpt. was designed in UK</li> <li>US Congress asked for Transcontinental RR (Western half privately funded, Eastern paid by government)</li> </ul>	Initially, then market-driven	Some “adapters” in South
Currency	Forever	<ul style="list-style-type: none"> <li>Occasionally fixed by governments, but often now allowed to float freely</li> </ul>	Spotty now	Yes, small fees to exchange—1% or less. Rip-offs still occur.
Diesel Gas Nozzles	?	<ul style="list-style-type: none"> <li>Diesel gas nozzles differ in diameter from regular</li> <li>Voluntary, but widely, not universally, adopted</li> </ul>	No	Done to avoid misuse/damage
Electricity	1890s and beyond	<ul style="list-style-type: none"> <li>First battle of AC versus DC, AC won out due to economics</li> <li>Europe different than US due to different companies, two voltages</li> <li>But 12 different plugs around the world still</li> </ul>	No	Cheap adapters available for travel

# Interoperability Examples -Logistics

Example	Date	Narrative	Gov't	Cost/Adapters
UPC/Barcode	1970s	<ul style="list-style-type: none"> <li>Idea created in 60s, but scanners were too expensive</li> <li>Retailers and manufacturers formed trade groups and wrestled over the standard</li> <li>Retail trade group and McKinsey issued RFP; IBM won</li> <li>Very slow initial adoption; nutrition labeling laws helped</li> <li>Coercion of retailers helped</li> <li>Scanner technology, EDI and Walmart added impetus (esp. EDI)</li> <li>Risk of lock-in</li> </ul>	No, retail drivers	<ul style="list-style-type: none"> <li>Fairly easy to print and stick on</li> <li>Cost from GS1 reasonable (non-profit owned by retailers and mfrs.)</li> </ul>
Pallets	1940s	<ul style="list-style-type: none"> <li>1920s start, popularized 1940s WWII</li> <li>Stringer versus block pallets</li> <li>And at least six recognized sizes to this day, no complete standardization</li> </ul>	No, just standards bodies with multiple standards	<ul style="list-style-type: none"> <li>Forklifts just maneuver around, lift differently</li> </ul>
Shipping containers	1960s	<ul style="list-style-type: none"> <li>Designed by Malcom Maclean, licensed free to ISO (though Malcom had built a shipping company to take advantage)</li> <li>Destroyed cartels and revolutionized shipping</li> <li>But did not do so in Mediteranean—lack of investment, industry structure</li> </ul>	<ul style="list-style-type: none"> <li>No, standard only</li> <li>Voluntary, widespread, but not uniform adoption</li> </ul>	<ul style="list-style-type: none"> <li>Drove out tons of cost from system</li> </ul>
EDI	1960s	<ul style="list-style-type: none"> <li>First used for shipping manifests, same inventor as Berlin airdrop coordinator in WWII</li> <li>First point to point, proprietary</li> <li>Then TDCC had three requirements: eqpt. agnostic, flexible, any speed of transmission, fixed format not how message was sent</li> <li>Then auto industry adopted, but not standard (1970s)</li> <li>ANSI stepped in as suppliers complained about lack of standards (1982)</li> <li>Grocery industry slow to adopt until mid 1980s, ANSI and UCC politics</li> <li>US Standard not same as Europe (EDIFACT)</li> <li>1987 Walmart abandons proprietary EDI with P&amp;G experiment</li> <li>No single flavor of XML, some lock in</li> </ul>	<ul style="list-style-type: none"> <li>Not really</li> </ul>	<ul style="list-style-type: none"> <li>Still incompatibility</li> <li>Still lots of mapping, system allows flexibility</li> <li>SPS Commerce is an entire business borne of this friction</li> </ul>

Example	Date	Narrative	Gov't	Cost/Adapters
Credit Card Networks	1950s	<ul style="list-style-type: none"> <li>• Interoperable at merchant level through government intervention, but otherwise not interoperable</li> <li>• BofA program became Visa to operate outside of CA</li> <li>• Competing Eastern banks became MasterCard</li> </ul>	Lots, especially as fees went up	<ul style="list-style-type: none"> <li>• Acquirers make 40 bps</li> <li>• Not all merchants take all cards, even if they have eqpt</li> </ul>
ACH Network	1960s-1970s	<ul style="list-style-type: none"> <li>• MICR system on checks was ABA, then local ACH networks sent just MICR, using local Feds</li> <li>• Feds ran national system and started its use by making payments to individuals that way</li> <li>• Over time, local groups formed NACHA through help of ABA, NACHA and Feds took almost 8 years to nationalize</li> <li>• There is a private operator NYCH/EPN which does 50% of commercial volumes and is owned by 20 banks</li> </ul>	Federal Reserve Involved	<ul style="list-style-type: none"> <li>• Expensive system, but no fees discounted on check by Fed rule!</li> </ul>
Bank ATMs	1970s	<ul style="list-style-type: none"> <li>• Citi started on its own network</li> <li>• Six banks (NYCE) responded</li> <li>• Visa and MasterCard started their own</li> <li>• Citi eventually joined NYCE</li> </ul>	No	Some banks charge fees, some reimburse some or all customers
EMV Chip and Pin Cards	1990s	<ul style="list-style-type: none"> <li>• Began in UK, with government study and concentrated banking industry</li> <li>• French chip experiment</li> <li>• Europay, MasterCard, Visa agreed (hence the name EMV)</li> </ul>	Pressure, no laws	Retail acceptance

# Interoperability Examples-PC/Workplace

Example	Date	Narrative	Gov't	Cost/Adapters
Microsoft Office Docs	1980s on	<ul style="list-style-type: none"> <li>Originally not very compatible (Wordperfect)</li> </ul>	Pressure, no laws	<ul style="list-style-type: none"> <li>Still not perfect, try google docs and MSFT docs!</li> </ul>
Mac and PC	1980s on	<ul style="list-style-type: none"> <li>Initially none</li> <li>Then some software developers chose to write for both platforms</li> <li>Eventually Mac made a version that ran Windows</li> </ul>	User pressure	<ul style="list-style-type: none"> <li>Still a pain in the ass sometimes</li> </ul>
Calendar Apps	1998-2009	<ul style="list-style-type: none"> <li>First standard proposed by IETF in 1998</li> <li>Revised and widely adopted, not universally by 2009</li> </ul>	IETF was spun out of gov't	<ul style="list-style-type: none"> <li>Still some glitches, Outlook versus Google, vs. Apple</li> </ul>
Email	1980	<ul style="list-style-type: none"> <li>Compatible standards in place</li> <li>Consumers must have some technical knowledge to make work</li> </ul>	IETF was spun out of gov't	<ul style="list-style-type: none"> <li>No cost, some time/frustration</li> </ul>
ERP	1990s	<ul style="list-style-type: none"> <li>No base level compatibility</li> <li>Entire industry of middleware to facilitate exchange</li> <li>Changing due to client pressure to avoid lock-in</li> </ul>	No	<ul style="list-style-type: none"> <li>Traditionally lots of costs, middleware, adapters, mapping</li> <li>Lessening</li> </ul>
Search Engines	1990s	<ul style="list-style-type: none"> <li>Not compatible</li> <li>Some meta search engines, but Google dominates</li> </ul>	No	<ul style="list-style-type: none"> <li>Just a little time to re-run</li> </ul>
Identity Management	2000s	<ul style="list-style-type: none"> <li>API identity sharing for consumers</li> <li>SAML 2.0 starting to be adopted</li> </ul>	No	<ul style="list-style-type: none"> <li>Very easy in consumer, painful in enterprise</li> </ul>
API	2000s	<ul style="list-style-type: none"> <li>Several standards (moving to rest)</li> <li>Consumer/customer driven</li> </ul>	No	<ul style="list-style-type: none"> <li>Relatively small</li> </ul>
Cloud Platforms (PAAS/IASS)	2000s	<ul style="list-style-type: none"> <li>Largely separate platforms right now</li> <li>Starting to see tools and standards to manage across platforms</li> </ul>	Not yet, some standards	<ul style="list-style-type: none"> <li>Will be fun to watch</li> </ul>

Example	Date	Narrative	Gov't	Cost/Adapters
E-readers	2000s	<ul style="list-style-type: none"> <li>Kindle book format incompatible, but app available on other devices</li> <li>Epub starting to be widely adopted against Amazon which does not support</li> </ul>	Only on prices	Two standards and app available, so not too much pressure
Itunes	2000s	<ul style="list-style-type: none"> <li>Very limited compatibility. Eventually added Windows support, but only for their equipment (spotty)</li> <li>Format not compatible, sharing limited</li> <li>No itunes support for other phones since iphone</li> </ul>	No	Fairly prototypical closed system Some complicated ways around
Social Networks	2000s	<ul style="list-style-type: none"> <li>Easy to add in, easy to share credentials, not easy to leave</li> <li>Open Social API gaining traction, but Google was slow to adopt, Facebook is a laggard with much to lose</li> </ul>	No	Share credentials, contacts in, hard to leave
TV Networks	1950s	<ul style="list-style-type: none"> <li>Shows are recorded in compatible formats, but networks do not share content, except in re-run form</li> <li>Formats do differ between countries</li> </ul>	No	Adapters necessary or incompatible formats
Video Game consoles		<ul style="list-style-type: none"> <li>Games may be on different platforms because developers port them, but they are not interoperable</li> </ul>	No	Need to buy multiple consoles and games
IM	1990s	<ul style="list-style-type: none"> <li>Attempts for unified protocol have failed, Msft, Yahoo, Aol use their own.</li> <li>Reuters built one that interoperates, msft and yahoo as well, some EIM interoperation</li> <li>Some have tried to build multi-compatible for consumers, but networks resist</li> </ul>	No	Most people still just multi-home and ask other to so as well. Very easy and free to use multiple systems.

Example	Date	Narrative	Gov't	Cost/Adapters
Universal Charger/USB 2.0	2009	<ul style="list-style-type: none"> <li>• Under threat from EC, 10 mfrs agreed to voluntarily use the micro-USB port</li> <li>• GSMA and ITU later</li> <li>• Korea tried two different standards of their own and belatedly went in line with rest of the world</li> <li>• Not at all clear US has adopted</li> </ul>	Yes, threat started the ball rolling in EU	<ul style="list-style-type: none"> <li>• Most settled on USB Micro</li> <li>• Apple provided a converter!</li> </ul>
Telephone Networks	1900s	<ul style="list-style-type: none"> <li>• Was a monopoly</li> <li>• Telecom Act of 1934 set the rules and prices for interoperability</li> </ul>	Yes, completely regulated	<ul style="list-style-type: none"> <li>• Eventually non-Bell equipment was allowed, now interconnection fees buried in rates</li> </ul>
Cellular networks	1990s	<ul style="list-style-type: none"> <li>• Most of the world is GSM, most of US is CDMA</li> <li>• GSM was a Euro standard adopted by law in 1987</li> <li>• Qualcomm, as US company is behind CDMA</li> </ul>	Euro yes, US less so, but interconnect yes	<ul style="list-style-type: none"> <li>• SIM cards</li> <li>• Changing phone</li> <li>• Or paying outrageous fees</li> <li>• All happen</li> </ul>
Fax machines	Late 60s+	<ul style="list-style-type: none"> <li>• Commercialized in 1970s</li> <li>• Several standards leveraging telecom committees from 1968 on, by 1980 ITU/NTT join in and Asia is on board</li> </ul>	Stds orgs from Telecom world	<ul style="list-style-type: none"> <li>• Initial issues between Europe and US, gone by early 1980s</li> </ul>

- Don't wait for the government, especially in the US!
- Standards bodies can help and so can sticking with standards
- Interoperability comes about through the concerted action of private players
  - Often there is a leader, and/or enemy resisting
    - Think Citi in ATMs
- Interoperability can take a long time to come about, but the long arc is towards interoperability as suppliers demand it and so do consumers
  - EDI, Barcodes, etc.
- Get interoperability right, do what is necessary to work smoothly, but do not constrain innovation
  - EDI probably did not have quite enough standardization on docs
  - ACH was too tight on allowances
- Big players typically resist for as long as possible, then come around
- Small guys often want to free-ride
- Need the folks in the middle to band together

# Thank you
